Tobacco-Related Disparities in New Mexico

This report summarizes commercial¹ tobacco use and exposure data for New Mexico’s adults and youth. People working to prevent tobacco use, support quitting, and eliminate exposure to secondhand smoke should use data from this report *in combination with other sources – including knowledge from communities –* to inform prioritization and planning.

The New Mexico Department of Health (DOH) Tobacco Use Prevention and Control (TUPAC) Program evaluation team analyzed the most recently available data from New Mexico’s well-established adult and youth risk behavior surveys. Estimates are provided for all key tobacco-related measures and among all priority population groups for which data could be reported.

Disparities occur when a group of people bears a disproportionate share – an unfair burden – of poor health or related harms. In this report, disparities in tobacco use prevalence, quitting, and exposure to secondhand smoke were found many groups in New Mexico. All disparities that could be measured by these surveys are indicated. However, there may be additional population groups experiencing tobacco-related disparities that cannot be captured by existing survey systems. For example, national research indicates that rates of smoking may be high among Korean and Vietnamese people,² but data are not sufficient to provide estimates for these specific populations in New Mexico.

Not all tobacco-related disparities can be measured by the state’s health behavior surveys. Other important causes of unfair burden include disproportionate targeted tobacco marketing; different levels of access to health care, planning, decision-making, capacity, and infrastructure; and inequitable availability of meaningful, effective interventions that reach specific population groups.

Summary of measured disparities

Disparities that were measurable with standard data collection systems within priority population groups are summarized here, and shown visually in the following table. Notably, although this report describes disparities considering only one characteristic at a time, there is overlap and intersectionality among many groups.

Race and Ethnicity

- **African American**

About one-fifth of African American adults in New Mexico smoke cigarettes (21%). African American adults who ever started smoking also have significantly lower measures of long-term quitting (43%), compared to 60% in the general population of adults who ever smoked. African American youth are more likely to report hookah smoking (11%) than the general youth population (8%).

- **American Indian**

The use of spit/chew tobacco among American Indian adults is high (6%), especially among American Indian men (9%), compared to the general population (4%). American Indian high school youth are more likely to report smoking cigarettes (12%) than the general youth population (9%). American Indian youth also report higher rates of cigar smoking (9%) and hookah smoking (9%) than the general youth population (both 8%).

- **Asian and Pacific Islander (API)**

¹ Throughout this report the term “tobacco” is used to refer to commercialized, addictive tobacco products. This term is not meant to include the traditional and beneficial use of tobacco by American Indian people in the Southwest.

² Centers for Disease Control and Prevention (CDC) <https://www.cdc.gov/tobacco/campaign/tips/resources/data/cigarette-smoking-in-united-states.html#five>

The number of API individuals who are included in New Mexico state surveys is small. Due to small numbers, rates are often reported in combination for people who are “Asian” or “Pacific Islander” although these are unique and culturally distinct groups. Further, these groups combine people from highly diverse cultures (e.g., Chinese, Korean, Vietnamese, and Filipino) that may be quite different from one another in terms of tobacco use and other important ways. Finally, state surveys are not conducted in languages other than English and Spanish. Therefore, there is a substantial data gap for API communities, which is a disparity on its own. Research indicates that cigarette smoking rates may be very high among some subgroups: up to one in three Korean or Vietnamese men may smoke cigarettes.³

- **Hispanic Ethnicity**

Hispanic men smoke cigarettes (21%) at a higher rate than the general adult male population (19%). Hispanic adults who ever smoked have significantly lower success in long-term quitting (55%), compared to 60% of the general population of adults. English-speaking Hispanic adults use spit/chew tobacco at higher rates (5%) than their Spanish-speaking counterparts (1%). Hispanic high school youth (37%) are more likely to report vaping than youth in the general population (34%).

Sexual Orientation and Gender Identity

- **Lesbian, Gay, Bisexual, and Queer (LGBQ+) Sexual Orientation**

All data for sexual orientation are analyzed within gender groups, to the extent that such data are available. Lesbian and bisexual female adults smoke cigarettes (27% and 26% respectively) at twice the rate of straight women (13%). Cigarette smoking is higher among gay, lesbian, bisexual male, and bisexual female youth (20%, 12%, 17%, and 16% respectively) than among straight youth (9%). Spit/chew tobacco use is higher among gay, bisexual male, and lesbian youth (24%, 15%, and 8% respectively) than among straight youth (6%). Vaping among lesbian and bisexual females (41% and 43% respectively) is higher than among straight female youth (34%). LGB youth are also significantly more likely to be exposed to secondhand smoke (45%) in the past week compared to straight youth (28%).

- **Transgender/Gender Nonconforming Gender Identity**

Questions about gender identity have only recently been added to state health surveys. Transgender/gender non-conforming youth and youth who are unsure or questioning their gender identity use tobacco in any form (use cigarettes, smokeless tobacco, cigars, e-cigarettes, or hookah) at higher rates than their cisgender peers. Cigarette smoking is higher among transgender/gender non-confirming and questioning high school youth (20% and 23% respectively) than among cisgender youth (7%). Spit/chew tobacco use is higher among transgender/gender non-confirming and questioning youth (20% and 26% respectively) than among cisgender youth (4%). Vaping among transgender/gender non-confirming and questioning youth (41% and 42%, respectively) is higher than among cisgender youth (33%). Transgender/gender non-confirming and questioning youth are also significantly more likely to be exposed to secondhand smoke (47% and 52% respectively) in the past week compared to straight youth (30%).

³ For example, see the Centers for Disease Control and Prevention (CDC) <https://www.cdc.gov/tobacco/disparities/asian-americans/index.htm> and https://appealforhealth.org/wp-content/uploads/2014/06/6135_APPEAL_AsianAmerican_factsheet_FINAL.pdf

Social Determinants of Health

- ***People Experiencing Poverty***

New Mexico has one of the highest rates of poverty in the US, with one in five people living under the federal poverty level.⁴ One in five (20%) of New Mexican adults who live below the poverty level smoke cigarettes, compared to 11% of adults above the poverty level. Cigarette smoking is also high among adults who are unemployed (29%), enrolled in Medicaid (26%), earn less than \$25,000/year (24%), have a high school education or less (21%), and rent their homes (24%).

Behavioral Health

- ***People Experiencing Substance Abuse or Dependence***

Cigarette smoking rates are about twice as high among New Mexican adults who report heavy alcohol use (37%) or overall poor mental health (29%). New Mexicans who report heavy alcohol use also have elevated rates of smokeless tobacco use (12%). Only 45% of people with heavy alcohol use and 43% of people with poor mental health have successfully quit smoking in their lifetime, compared to 60% of the general population of smokers.

- ***People Experiencing Mental Health Challenges***

High school youth experiencing depressive symptoms are more likely to smoke cigarettes (13%), use spit/chew tobacco (7%), use e-cigarettes (43%), smoke cigars (11%), and use hookah (11%), than youth who are not experiencing depressive symptoms. Youth using other substances like alcohol and marijuana are also more likely to use any of these forms of tobacco.

Chronic Conditions

- ***People with Disabilities***

Cigarette smoking among NM adults with disabilities (25%) is higher than the general population (16%). Disabled adult smokers also have significantly lower success in quitting cigarettes over their lifetime (53%), compared to 60% of the general population of smokers. High school youth with a physical disability are more likely to smoke cigarettes (12%), use smokeless tobacco (9%), smoke cigars (12%), use hookah (11%), use e-cigarettes (39%), and use any form of tobacco (44%) than their peers without a physical disability. Youth with disabilities are also more likely to be exposed to secondhand smoke (40%) in the past week compared to youth without disabilities (31%).

- ***People with Chronic Disease***

Almost one in five (19%) NM adults with asthma smoke cigarettes. NM high school students who are overweight or obese are more likely to smoke cigarettes (10%) than those who are not overweight/obese (8%). Youth with asthma are more likely to be exposed to secondhand smoke (36%) in the past week compared to youth without asthma (31%).

Overweight/Obese									

*Any type of tobacco; ***Quitting barriers* is measured by the Quit Ratio (% quitters among lifetime smokers).

Methods

Data Sources

Adult data in this report are from the New Mexico Behavioral Risk Factor Surveillance System (BRFSS). BRFSS data from 2017-2019 were combined to provide sufficient numbers for reporting. The BRFSS is a random-digit-dialed telephone survey of New Mexico adults. It is sponsored by the Centers for Disease Control and Prevention (CDC), and conducted in all states and US territories. The survey asks numerous health-related questions, in English and Spanish. More information about New Mexico’s BRFSS is available at <https://www.nmhealth.org/about/erd/ibeb/brfss/>

Youth data in this report are from the 2019 New Mexico Youth Risk and Resiliency Survey (YRRS). The YRRS is a school-based survey conducted among New Mexico’s high school students (grades 9-12) and middle school students (grades 6-8). It is conducted in a classroom setting using paper questionnaires, in English and Spanish. Official statewide results for YRRS are from a random sample of schools; however, all schools in the state can participate in order to receive school and community reports. Because the purpose of this report is to report on all possible subpopulations, we used the larger dataset that includes all participating schools, instead of the smaller statewide sample. For this reason, some results in this report may be different from official statewide results. For more information about the YRRS please see <http://youthrisk.org/>

More details about survey measures are included in the Data Sources section at the end of this report.

Prevalence Estimates per Group

Each page of this report includes a chart showing the prevalence of a specific tobacco-related variable. Some variable estimates are also shown for males alone and females alone when there are important patterns of disparity differences by gender.

For each figure, the statewide prevalence for adults or youth is shown as a dashed line. The statewide value is reported in text at the top of the page. Horizontal bars show the prevalence among specific subgroups.

Comparing Groups

In order to describe disparities, priority population subgroups were compared to a “referent group” (usually the largest-size group) as indicated in the table below. For example, gay and bisexual male adults were compared to straight male adults; people with disabilities were compared to people without disabilities. All non-Hispanic race groups were compared to non-Hispanic white, and Spanish-speaking Hispanics were compared to English-speaking Hispanics.

Priority population	Adult referent group	Youth referent group
Age: Young adults ages 18-39	Age 30 or older	
Sex: Male	Female	Female
Gender identity: Transgender/Gender nonconforming	Cisgender	Cisgender
Gender identity: Unsure/questioning		Cisgender
Race/Ethnicity: American Indian, Asian/Pacific Islander, Black or African American, Hispanic	White, non-Hispanic	White, non-Hispanic
Language among Hispanics: Spanish-speaking Hispanic	English-speaking Hispanic	English-speaking Hispanic
Sexual orientation: Gay male, bisexual male	Straight male	Straight male

Priority population	Adult referent group	Youth referent group
Sexual orientation: Lesbian female, bisexual female	Straight female	Straight female
Social determinant: Below federal poverty level	At or above poverty level	
Social determinant: Annual household income less than \$25,000	\$25,000 or more	
Social determinant: Highest level of education is high school/GED or less	Some college or more	
Social determinant: Unemployed	Employed	
Social determinant: Uninsured	Have health insurance	
Social determinant: Rent their home	Own their home	
Social determinant: Mostly Cs, Ds, Fs in school		Mostly As, Bs in school
Social determinant: Parent's highest education is high school or less		Parents have at least some college education
Social determinant: Unstable housing		Stable housing
Behavioral health: Poor mental health on 14+ days in past month	Fewer than 14 poor mental health days	
Behavioral health: Depression		Not depressed
Behavioral health: current alcohol drinking (any in past 30 days)		No drinking in past 30 days
Behavioral health: heavy alcohol drinking	Minimal or no drinking	
Behavioral health: current marijuana use (any in past 30 days)		No marijuana use in past 30 days
Chronic conditions: Any disability	No disability	No disability
Chronic conditions: With diabetes	No diabetes	
Chronic conditions: With asthma	No asthma	No asthma
Chronic conditions: Overweight or obese	Healthy weight or less	Healthy weight or less

Differences between groups are marked if they are statistically significant at the 95% level of confidence – meaning outside the margin of error, therefore differences not only due to chance.

* indicates significantly greater (“worse”) than the comparison group

† indicates significantly lower (“better”) than the comparison group

Comparisons among groups were age and sex-adjusted. This means that formal statistical tests were used to separate differences that are the result of age and sex distributions in populations, rather than from other factors. For example, LGB adults tend to be younger on average than straight adults, and younger adults also sometimes use tobacco products more often than older adults, so the statistical tests we used to compare LGB and straight adults factored in the differences in age so that differences we reported are more likely the really associated with LGB or straight sexual orientation.

Among youth, comparisons did not need to be adjusted because the distributions of age and sex among youth subpopulations that were compared are more uniform.

Limitations

Data reported here are based on surveys and are subject to multiple limitations. Most importantly, the design of these surveys may exclude some people. The BRFSS is a telephone survey conducted in English and Spanish; adults without telephone service or with unstable service, or who speak other languages, would not be able to take the survey. Similarly, the YRRS is a student survey, so youth who are not enrolled in school, or who do not attend regularly, are not represented. For both surveys, people who are excluded may be priority populations, so this is an important gap.

As noted previously, even when people from priority populations are included, survey questions may not appropriately identify them, or the design of the surveys may not provide enough numbers of specific groups of people to report stable estimates or any estimates at all of their responses.

Population Sizes and Distribution

This section helps to understand the demographics of current smokers and smokeless tobacco users. For example, Table 1 indicates that among an estimated 263,300 total adults who smoke in New Mexico statewide (first row) that 49% are below the federal poverty level, even though only 34% of all survey respondents are below the federal poverty level (row 22). This is another way to think about disparity: people experiencing poverty represent a disproportionate share of the population of people who smoke because the prevalence of smoking is greater within this group than for those not experiencing poverty.

Numbers of Adults

Table 1: Number and Percent of New Mexico Adults in Subpopulations, among Total, Current Smoking, and Current Smokeless Tobacco Use groups

Adult Groups	Total Respondents within survey	Percent and Number of People Within Groups, Among Current Smokers		Percent and Number of People Within Groups, Among Current Smokeless Tobacco Users	
	%	%	Number	%	Number
<i>Source: 2017-2019 NM BRFSS</i>

Not Using Marijuana	1.8%	0.000	1.3%	0.000	8.8%	0.000	10.2%	0.000
Current Marijuana Use	25.3%		17.3%		66.9%		73.9%	
Chronic Conditions: Asthma								
No Asthma	4.3%	0.615	3.0%	0.926	14.8%	0.041	16.9%	0.021
Asthma	4.1%		3.0%		17.3%		19.8%	
Chronic Conditions: Describes Self as Overweight								
Not as Overweight	4.2%	0.391	2.8%	0.128	14.8%	0.733	16.8%	0.196
As Overweight	4.7%		3.5%		15.6%		18.4%	

*p-value less than 0.05 indicates a significant difference between groups

Data Sources

Adult data

Data source. This report used data from the New Mexico Behavioral Risk Factor Surveillance System (BRFSS) for 2017-2019 combined. When noted, some measures may only be available for specific years. More information about New Mexico's BRFSS is available at <https://www.nmhealth.org/about/erd/ibeb/brfss/>. A copy of the 2019 BRFSS questionnaire is available at <https://www.cdc.gov/brfss/questionnaires/pdf-ques/2019-BRFSS-Questionnaire-508.pdf>

Methods. Outcomes are presented descriptively (i.e., prevalence estimates are reported by stratified group).

Significance testing for binary groups. Chi square tests were used to assess associations between the outcome of interest and group status for binary category groups (e.g., people with diabetes compared to people without diabetes). P-values are reported for these chi square tests, and displayed to indicate which two groups were compared. Values are highlighted if $p < .05$ (statistical significance at the 95% confidence level).

Significance testing for categorical groups. For groups with multiple categories (race/ethnicity and sexual orientation), regression models were used to independently compare each category to a referent group. For race, groups were compared to non-Hispanic whites; for sexual orientation, gay, lesbian, and bisexual groups were compared to straight/heterosexual groups within gender. Formal statistical comparisons between adult subgroups were conducted using regression models that adjusted for age and gender. This means when differences are reported as significant, this is true when comparing people who are the same age and gender. Such adjustments are important because age and gender can both be associated with tobacco use, and the distributions of age and gender can be different by population; for example, gay, lesbian, and bisexual adult groups in BRFSS are younger on average than straight/heterosexual groups, so adjusting for age assures that differences reported between groups are not explained by age differences between the groups.

Suppression. Results with less than 50 respondents in the denominator are suppressed.

Outcome definitions

- **Cigarette smoking.** Respondent has smoked at least 100 cigarettes in their lifetime, and currently smokes "every day" or "some days".
- **Smokeless tobacco (SLT) use.** Respondent currently uses chewing tobacco, snuff, or snus, "every day" or "some days". No lifetime screening question.
- **Any tobacco product use.** Respondent currently uses *any* tobacco or nicotine product. This measure reports any use of cigarette smoking and smokeless tobacco.

Group definitions

- **Age.** Grouped by self-reported age as 18-29 years old ("young adult") or 30 years and older.
- **Sex and Gender identity.** Adults are asked about their sex and can answer "male" or "female". Beginning in 2016, adults have been asked "Do you consider yourself to be transgender?" Adults can answer: "Yes, Transgender, male-to-female"; "Yes, Transgender, female to male"; "Yes, Transgender, gender nonconforming"; or "No". For this report, biological sex and gender identity are analyzed separately. There are not enough respondents to report results for specific transgender groups, so all transgender/gender nonconforming adults combined are compared to cisgender (non-transgender) adults.
- **Race/ethnicity and language.**
 - **Race/Hispanic ethnicity.** Based on single indicator that incorporates separate questions on race and Hispanic ethnicity. Respondents are categorized first by reported race, or "preferred race" among those who reported more than one race; then Hispanic ethnicity is incorporated, and people who reported being Hispanic are categorized as Hispanic regardless of race.

- **Language.** Among people who are identified as Hispanic, this is an indicator of whether they took the BRFSS in Spanish or English language.
- **Sexual orientation.** This measure is reported stratified by gender, based on self-reported orientation of the respondent. Male respondents are categorized as Heterosexual/straight Male, Gay, or Bisexual Male. Female respondents are categorized as Heterosexual/straight Female, Lesbian, or Bisexual Female. Respondents who reported “Other” or “Don’t know/Not sure” are not included.
- **Social determinants of health.** These are measures of socioeconomic status, which are frequently associated with health.
 - *Federal Poverty Level.* “Poverty level” is based on Poverty Guidelines from the U.S. Department of Health & Human Services (<https://aspe.hhs.gov/poverty-guidelines>) according to income and then number of adults and children in the household. The threshold for poverty is extremely low (e.g., \$26,200 annual income for a family of 4 in 2020); this report categorizes people for poverty risk based on 150% of the federal poverty level (e.g., \$39,300 for a family of four – 150% of \$26,200).
 - *Income:* Respondents report annual household income from all sources. This measure does not incorporate household size. The threshold of \$25,000 has been commonly used in NM BRFSS analysis by public health programs.
 - *Level of Education:* This is the highest level of formal education completed. High School or Less includes "Never attended school or only attended kindergarten", "Grades 1 through 8 (Elementary)", "Grades 9 through 11 (Some high school)" and "Grade 12 or GED (High school graduate)". Some College includes "College 1 year to 3 years (Some college or technical school)" and "College 4 years or more (College graduate)".
 - *Employment:* This is current employment status. Employed includes currently “Employed for wages” or “Self-employed”. Unemployed includes “Out of work for 1 year or more” or “Out of work for less than a year”. People who are report “Homemaker”, “A student”, “Retired” or “Unable to work” are not included.
 - *Insurance coverage.* Respondents are asked "Do you have any kind of health care coverage, including health insurance, prepaid plans such as HMOs, or government plans such as Medicare, or Indian Health Service?" Responses are yes or no.
 - *Medicaid enrollment* (not included in 2017 NM BRFSS, included in 2018-19):: Includes "Medicaid" responses to the question: "What is the primary source of your health care coverage?"
 - *Home ownership status.* Owning a home is one measure of economic security. Respondents are asked "Do you own or rent your home?"
- **Behavioral Health.**
 - *General Mental Health:* General mental health is categorized based on recommendations by CDC. Respondents are asked "Now thinking about your mental health, which includes stress, depression, and problems with emotions, for how many days during the past 30 days was your mental health not good?" “Poor” Mental Health is defined as 14 or more of the past 30 days; non-poor physical health includes response "None" or 1-13 days.
 - *Suicidal thoughts* (not included in 2016 NM BRFSS, included in 2017-18): Includes “Yes” responses for the question: “In the past year, have you felt so low at times that you thought about committing suicide?”
 - *Lifetime Suicide Attempt* (not included in 2016 NM BRFSS, included in 2017-18): Includes “Yes” responses for the question: “Have you ever attempted suicide?”.
 - *Heavy Alcohol Drinking.* Respondents are asked how many days per month they drank alcohol, and how many drinks they had per occasion. Heavy drinking is calculated based on CDC thresholds, and specific to gender: men who had more than 14 drinks per week and adult women who had more than 7 drinks per week.

- *Binge Drinking*: Respondents are specifically asked the maximum number of drinks they had on a single occasion in the past month. “Binge drinking” is defined by CDC, and includes male respondents who reported 5 or more drinks, and female respondents who reported 4 or more drinks, on one or more occasions in the past month.
- **Chronic Conditions.**
 - *General Physical Health*: General physical health is categorized based on recommendations by CDC. Respondents are asked “During the past 30 days, for about how many days did poor physical or mental health keep you from doing your usual activities, such as self-care, work, or recreation?”. “Poor” Physical Health is defined as 14 or more of the past 30 days; non-poor physical health includes response “None” or 1-13 days.
 - *Disability*. The general disability category includes “any disability” for the following 6 questions. We also report by yes/no answer to each of the individual questions: “Are you deaf or do you have serious difficulty hearing?”, “Are you blind or do you have serious difficulty seeing, even when wearing glasses?”, “Because of a physical, mental, or emotional condition, do you have serious difficulty concentrating, remembering, or making decisions?”, “Do you have serious difficulty walking or climbing stairs?”, “Do you have difficulty dressing or bathing?”, and “Because of a physical, mental, or emotional condition, do you have difficulty doing errands alone such as visiting a doctor’s office or shopping?”. For more information on the CDC BRFSS disability module, see https://www.cdc.gov/brfss/data_documentation/pdf/BRFSS_Data_Users_Guide_on_Disability_Questions_2018-508.pdf
 - *Asthma*. Includes “Yes” responses to both of the following questions: “Has a doctor, nurse, or other health professional ever told you have asthma?” and “Do you still have asthma?”.
 - *Diabetes*: Includes “Yes” responses to the question: “Has a doctor, nurse, or other health professional ever told you that you had diabetes?” Reports of gestational diabetes are excluded.
 - *Obese/overweight*: Respondent-reported height and weight are used to compute body mass index, and adults who have a body mass index greater than 25.00 are classified as obese/overweight.

Youth data

Data source. New Mexico Youth Risk and Resiliency Survey (YRRS) for 2019. Separate surveys are conducted in middle schools and high schools. For more information about the YRRS please see <http://youthrisk.org/> The questionnaires are available at <https://youthrisk.org/data-collection/questionnaires/>

Methods. Outcomes are presented descriptively (i.e., prevalence estimates are reported by stratified group).

Significance testing for binary groups. Chi square tests were used to assess associations between the outcome of interest and group status for binary category groups (e.g., youth with asthma compared to people without asthma). P-values are reported for these chi square tests, and displayed to indicate which two groups were compared. Values are highlighted if $p < .05$ (statistical significance at the 95% confidence level).

Significance testing for categorical groups. For groups with multiple categories (race/ethnicity and sexual orientation), regression models were used to independently compare each category to a referent group. For race, groups were compared to non-Hispanic whites; for sexual orientation, gay, lesbian, and bisexual groups were compared to straight/heterosexual.

Suppression. Results with less than 50 respondents in the denominator are suppressed.

Outcome definitions.

- **Cigarette smoking.** Respondent has smoked cigarettes on at least one day in the past 30 days.
- **Smokeless tobacco (SLT) use.** Respondent has smoked cigarettes on at least one day in the past 30 days.
- **Electronic vapor product use (“e-cigarettes” or “vapes”).** Respondent used an e-cigarette or vaped on at least one day in the past 30 days.
- **Cigar smoking.** Respondent has smoked cigars on at least one day in the past 30 days.
- **Hookah smoking.** Respondent has smoked hookah on at least one day in the past 30 days.
- **Any tobacco product use.** Respondent currently uses *any* tobacco or nicotine product. This measure reports any use of cigarette smoking, smokeless tobacco, e-cigarettes, cigars, and hookah.

Group definitions.

- **Grade.** Grouped by self-reported grade level in school, grades 6 through 12.
- **Sex and Gender identity.** Youth are asked “What is your sex?”, and can answer “male” or “female.” A question on gender identity was added to the High School YRRS in 2017: “Do you consider yourself transgender, genderqueer, or genderfluid?” Youth can respond “yes”, “no”, or “I don’t know”. Responses to these questions on sex and gender identity are analyzed separately.
- **Race/ethnicity and language.**
 - **Race/Hispanic ethnicity.** Based on single indicator that incorporates separate questions on race and Hispanic ethnicity. Respondents are categorized first by reported race, then Hispanic ethnicity is incorporated, and people who reported being Hispanic are categorized as Hispanic regardless of race.
 - **Language.** Among people who are identified as Hispanic, this is an indicator of whether they took the YRRS in Spanish or English language.
- **Sexual orientation.** This measure is reported stratified by gender, based on self-reported orientation of the respondent. Male respondents are categorized as Heterosexual/straight Male, Gay, or Bisexual Male. Female respondents are categorized as Heterosexual/straight Female, Lesbian, or Bisexual Female. Respondents who reported “Other” or “Not sure” are not included.
- **Social determinants of health.** These are measures of socioeconomic status, which are frequently associated with health. The following four
 - *C’s, D’s or F’s in School: Self-reported grades during the past 12 months of school as “Mostly C’s”, “Mostly D’s”, or “Mostly F’s”. Respondents who reported “None of these grades” or “Not sure” are not included.*
 - *Parent’s Education Level High School or Less:* This is the highest level of education completed by either the mother or the father. Includes responses “Completed grade school or less”, “Some High School”, or “Completed High School”. Respondents who selected “Not sure” for both parents are excluded.
 - *Unstable Housing:* Students were asked where they typically sleep at night. Answers included “in my parent’s or guardian’s home” (stable) and other answers that were considered as unstable housing included “In a friend's or relative's home...because I had to leave my home or my parent/guardian cannot afford housing”, “In a foster home or group facility”, “In a shelter or emergency housing”, “In a hotel or motel”, “In a car, park, campground, or other public place”, or “I moved from place to place” responses.
 - *No Dental Visit in Past Year (only used for Middle School students):* Students were asked when was the last time they saw a dentist for a check-up, exam, tenth cleaning, or other dental work. Includes “Between 12 and 24 months ago”, “More than 24 months ago”, “Never”, and “Not sure” responses.
- **Behavioral Health.**
 - *Depression:* Student were asked if they felt sad or hopeless almost every date for two weeks ore more in a row. “Yes” responses are included.
 - *Current Alcohol Drinking.* Respondent has drank alcohol on at least one day in the past 30 days.
 - *Current Marijuana Use:* Respondent has used marijuana on at least one day in the past 30 days..
- **Chronic Conditions.**

- *Disability*. Students were asked if they had any physical disabilities or long-term health problems. “Yes” responses are included.
- *Asthma*. Includes “Yes” responses to both of the following questions: “Has a doctor or nurse ever told you have asthma?” and “Do you still have asthma?”.
- *Obese/overweight*: Respondent-reported age, sex, height and weight are used to compute body mass index, and youth who have a body mass index in the 85th percentile or greater are classified as obese/overweight.
- *Describe Self as Overweight (only used for Middle School students)*: Responses “Slightly overweight” and “Very overweight”.
